Graphic LCD Controller Module Using Firmware Integration Technology

Introduction

This application note describes the graphic LCD controller module using firmware integration technology (FIT). This module uses the graphic LCD controller (GLCDC) to display image data on the liquid crystal display (LCD) panel.

This module is hereinafter referred to as GLCDC FIT module.

Target Devices

The following is a list of devices that are currently supported by this API:

• RX65N, RX651 Groups, ROM capacity: 1.5 MB to 2 MB

When using this application note with other Renesas MCUs, careful evaluation is recommended after making modifications to comply with the alternate MCU.

1. Overview

1.1 GLCDC FIT Module

The GLCDC FIT module can be used by implementing it to the project. For implementing the GLCDC FIT module, refer to 2.12 Adding FIT Module to Your Project.

1.2 Overview of the GLCDC FIT Module

The GLCDC FIT module uses the GLCDC to provide the method to output image data to the LCD panel in the graphics format which supports the graphics data read from the memory.

The GLCDC FIT module supports the following features:

- 32- or 16-bit per pixel graphics data and 8-, 4-, or 1-bit CLUT (color lookup table) data format
- Superimposition of three planes and alpha blending of two planes
- Correction of brightness, contrast, and RGB gamma for the LCD panel to output image data
- Parallel data output of RGB888, RGB666, and RGB565. Dithering for the output data format.

1.3 Summary of the API

Table 1.1 lists API functions included in the GLCDC FIT module:

Table 1.1 API Functions

Function	Description
R_GLCDC_Open	Initializes the GLCDC FIT module.
R_GLCDC_Close	Closes the GLCDC FIT module.
R_GLCDC_Control	Performs control processing for the GLCDC FIT module.
R_GLCDC_LayerChange	Changes operation of graphics 1 and graphics 2 of the GLCDC.
R_GLCDC_ColorCorrection	Changes settings for brightness, contrast, and gamma correction of the GLCDC.
R_GLCDC_ClutUpdate	Updates the CLUT memory of the GLCDC.
R_GLCDC_GetStatus	Obtains the GLCDC status.
R_GLCDC_GetVersion	Returns the version number of the GLCDC FIT module.

1.4 State Transition

Figure 1.1 shows the state transition diagram of the GLCDC FIT module.

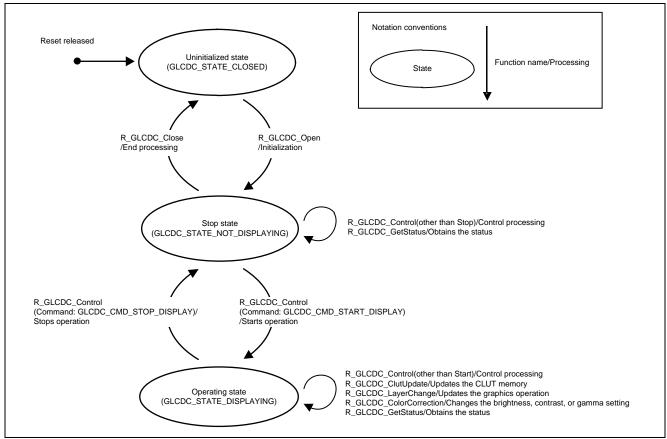

Figure 1.1 State Transition Diagram of the GLCDC FIT Module

1.5 Limitations

The GLCDC FIT module has the following limitations.

- Output of serial RGB data is not supported.
- Input of an external clock (LCD_EXTCLK) is not supported.

2. API Information

The sample code in this application note has been run and confirmed under the following conditions.

2.1 Hardware Requirements

This FIT module requires that your MCU support the following features:

GLCDC

2.2 Software Requirements

This FIT module is dependent upon the following packages:

• Renesas Board Support Package (r_bsp).

2.3 Supported Toolchains

This FIT module is tested and working with toolchains listed in 6.1 Operation Confirmation Environment.

2.4 Interrupt Vector

When the R_GLCDC_Open function is executed, the VPOS, GR1UF, and GR2UF interrupts are enabled according to the parameter values.

Table 2.1 lists the interrupt vector used in the GLCDC FIT Module.

Table 2.1 Interrupt Vector Used in the GLCDC FIT Module

Device	Interrupt Vector		
RX65N	GROUPAL1 interrupt (vector no. : 113) • VPOS interrupt (group interrupt source number: 8) • GR1UF interrupt (group interrupt source number: 9) • GR2UF interrupt (group interrupt source number: 10)		

2.5 Header Files

All API calls and their supporting interface definitions are located in file "r_glcdc_rx_if.h".

2.6 Integer Types

The GLCDC FIT module uses ANSI C99. These types are defined in file "stdint.h".

R01AN3609EJ0100 Rev. 1.00 Oct. 02, 2017

2.7 Configuration Overview

All configurable options that can be set at build time are located in file "r_glcdc_rx_config.h". A summary of these settings are provided in the following table.

Configuration options in r_glcdc_rx_config.h				
GLCDC_CFG_PARAM_CHECKING_ENABLE 1	Defines whether to include parameter checking in the code or not. If the equate is set to 0, the parameter checking is omitted from the build and code size is reduced. If the equate is set to 1, parameter checking is included in the build.			
GLCDC_CFG_INTERRUPT_PRIORITY_LEVEL 5	Specifies the interrupt priority level for the group AL1 interrupt. Specify the level from 0 to 15.			

2.8 Code Size

Typical code sizes associated with the GLCDC FIT module are listed below.

The ROM (code and constants) and RAM (global data) sizes are determined by the build-time configuration options described in 2.7 Configuration Overview. The table lists reference values when the C compiler's compile options are set to their default values, as described in 2.3 Supported Toolchains. The compile option default values are optimization level: 2, optimization type: for size, and data endianness: little-endian. The code size varies depending on the C compiler version and compile options.

ROM, RAM and Stack Code Sizes						
Device	evice Category		Memory Used		Remarks	
			With Parameter Checking	Without Parameter Checking		
RX65N	ROM	-	10253bytes 7171bytes			
	RAM	-	114bytes			
	Maximum sta	ack usage	248bytes		Multiple interrupt is prohibited. Thus only the maximum value for when 1 channel is used is listed.	

2.9 Parameters

This section describes the API data structures used as arguments for the API functions. These structures are located in file "r_glcdc_rx_if.h" as are the prototype declarations.

```
/* Settings for the GLCDC Main */
typedef struct st_glcdc_cfg

2.10 Return Value

This section describes return values for the API functions. This enumeration is located in file "r_glcdc_rx_if.h" as are the prototype declarations.

```
/* GLCDC return values */
typedef enum e_glcdc_err
  GLCDC SUCCESS = 0,
                                    // Processing has been completed
                                   // successfully.
                                   // NULL pointer is passed to the parameter.
  GLCDC ERR INVALID PTR,
  GLCDC ERR LOCK FUNC,
                                   // GLCDC resource is used by another process
  GLCDC ERR INVALID ARG,
                                   // Invalid argument value
                                   // Function cannot be executed in this mode.
  GLCDC ERR INVALID MODE,
  GLCDC ERR NOT OPEN,
                                   // R GLCDC Open has not been executed.
  GLCDC_ERR_INVALID_TIMING_SETTING, // Register update timing is invalid.
  GLCDC ERR INVALID LAYER SETTING, // Graphics screen setting is invalid.
  GLCDC ERR INVALID_ALIGNMENT,
                                   // Start address of the frame buffer is
                                    // invalid.
  GLCDC ERR INVALID GAMMA SETTING, // Gamma correction setting is invalid.
  GLCDC ERR INVALID UPDATE TIMING, // Update timing of the register value is
                                    // invalid.
  GLCDC ERR INVALID CLUT ACCESS,
                                   // CLUT memory setting is invalid.
  GLCDC ERR INVALID BLEND SETTING, // Setting for blending is invalid.
} glcdc err t;
```

2.11 Callback Function

In the GLCDC FIT module, a callback function set up by the user is called when the VPOS interrupt, the GR1UF interrupt, or the GR2UF interrupt occurs.

The callback function is set up by storing the address of the callback function in the p_callback structure member described in 2.9 Parameters. When the callback function is called, the variable that holds the constant listed in Table 2.2 is passed as a parameter.

Since the argument type is passed as a pointer to void type, a variable of type pointer to void should be used as the callback function parameter. See an example below as a reference.

To use the passed value in the function, its type should be cast to an appropriate type.

Unintended specified line notification from graphic 2 and graphic 1,2 underflow is detected only for first time after release GLCDC software reset. Therefore, do nothing with first VPOS interrupt processing after execution of R_GLCDC_Open function, execute user process from next interrupt.

Table 2.2 Parameters for the Callback Function (enum glcdc_event_t)

Constant Definition	Description
GLCDC_EVENT_LINE_DETECTION	Callback function called from the VPOS interrupt handling
GLCDC_EVENT_GR1_UNDERFLOW	Callback function called from the GR1UF interrupt handling
GLCDC_EVENT_GR2_UNDERFLOW	Callback function called from the GR2UF interrupt handling

2.12 Adding FIT Module to Your Project

This module must be added to each project in which it is used. Renesas recommends using "Smart Configurator" described in (1) or (3). However, "Smart Configurator" only supports some RX devices. Please use the methods of (2) or (4) for unsupported RX devices.

- (1) Adding the FIT module to your project using "Smart Configurator" in e² studio
 By using the "Smart Configurator" in e² studio, the FIT module is automatically added to your project. Refer
 to "Renesas e² studio Smart Configurator User Guide (R20AN0451)" for details.
- (2) Adding the FIT module to your project using "FIT Configurator" in e² studio
 By using the "FIT Configurator" in e² studio, the FIT module is automatically added to your project. Refer to
 "Adding Firmware Integration Technology Modules to Projects (R01AN1723)" for details.
- (3) Adding the FIT module to your project using "Smart Configurator" on CS+ By using the "Smart Configurator Standalone version" in CS+, the FIT module is automatically added to your project. Refer to "Renesas e² studio Smart Configurator User Guide (R20AN0451)" for details.
- (4) Adding the FIT module to your project in CS+ In CS+, please manually add the FIT module to your project. Refer to "Adding Firmware Integration Technology Modules to CS+ Projects (R01AN1826)" for details.

3. API Functions

R_GLCDC_Open ()

This function initializes the GLCDC FIT module. This function must be called before calling any other API functions.

Format

Parameters

```
glcdc\_cfg\_t * p\_cfg
```

Pointer to the GLCDC setting data structure.

The following table lists the glcdc_cfg_t structure members and setting values to be referenced. Only parameters listed below are referenced. Thus the other parameters do not need to be specified when this function is executed.

Table 3.1	alcdc cfa	t Structure	Members	and Setting Values	:

Structure Member	Outline	Setting Value	Description
output.htiming. back_porch	Horizontal back porch	See 5.1 Screen Definition.	Specifies the assertion timing of the STHy signal and the start position of the horizontal active display.
output.htiming. sync_width	Horizontal assertion width	See 5.1 Screen Definition.	Specifies the assertion timing of the STHy signal, the STHy signal assertion width, and the start position of the horizontal active display.
output.vtiming. back_porch	Vertical back porch	See 5.1 Screen Definition.	Specifies the assertion timing of the STVy signal and the start position of the vertical active display.
output.vtiming. sync_width	Vertical assertion width	See 5.1 Screen Definition.	Specifies the assertion timing of the STVy signal, the STVy signal assertion width, and the start position of the vertical active display.
output.htiming. display_cyc	Horizontal active display width	See 5.1 Screen Definition.	Specifies the STHy signal assertion width and the horizontal active display width.
output.vtiming. display_cyc	Vertical active display width	See 5.1 Screen Definition.	Specifies the STVy signal assertion width and the vertical active display width.
output.htiming. front_porch	Horizontal front porch	See 5.1 Screen Definition.	Specifies the horizontal active display width and the start position of horizontal active display.

output.vtiming. front_porch	Vertical front porch	See 5.1 Screen Definition.	Specifies the vertical active display width and the start position of vertical active display.
p_callback	Pointer to the callback function	Address of the callback function	Executes the callback function at the address designated by the pointer when an interrupt source occurs.
		FIT_NO_FUNC or NULL	The callback function is not executed even if an interrupt source occurs.
output.clksrc	Clock source	GLCDC_CLK_ SRC_INTERNAL	PLL clock is used.
output.clock_div_ratio	Clock division ratio	1/1 to 1/32 (see "glcdc_panel_clk_div_t" in 2.9 Parameters for details.	Specifies the division ratio for LCD_CLK.
output.format	Output data format	GLCDC_OUT_FORMAT_ 24BITS_RGB888	Sets RGB888 as the output data format and the output format, and sets the pixel clock to 'no division'.
		GLCDC_OUT_FORMAT_ 18BITS_RGB666	Sets RGB666 as the output data format and the output format, and sets the pixel clock to 'no division'.
		GLCDC_OUT_FORMAT_ 16BITS_RGB565	Sets RGB565 as the output data format and the output format, and sets the pixel clock to 'no division'.
output.sync_edge	Output phase control for TCON	GLCDC_SIGNAL_ SYNC_EDGE_RISING	Outputs synchronizing with a rising edge of LCD_CLK.
	and DATA	GLCDC_SIGNAL_ SYNC_EDGE_FALLING	Outputs synchronizing with a falling edge of LCD_CLK.
output.tcon_hsync	Output pin of the horizontal sync	GLCDC_TCON_PIN_0	TCON0 is used for HSYNC output.
	signal (HSYNC)	GLCDC_TCON_PIN_1	TCON1 is used for HSYNC output.
		GLCDC_TCON_PIN_2	TCON2 is used for HSYNC output.
		GLCDC_TCON_PIN_3	TCON3 is used for HSYNC output.
output.hsync_polarity	horizontal sync	GLCDC_SIGNAL_ POLARITY_LOACTIVE	Sets polarity to low active.
	signal (HSYNC)	GLCDC_SIGNAL_ POLARITY_HIACTIVE	Sets polarity to high active.
output.tcon_vsync	Output pin of the vertical sync signal	GLCDC_TCON_PIN_0	TCON0 is used for VSYNC output.
	(VSYNC)	GLCDC_TCON_PIN_1	TCON1 is used for VSYNC output.

		GLCDC_TCON_PIN_2	TCON2 is used for VSYNC output.
		GLCDC_TCON_PIN_3	TCON3 is used for VSYNC output.
output.vsync_polarity	Polarity of the vertical sync signal	GLCDC_SIGNAL_ POLARITY_LOACTIVE	Sets polarity to low active.
	(VSYNC)	GLCDC_SIGNAL_ POLARITY_HIACTIVE	Sets polarity to high active.
output.tcon_de	Output pin of the	GLCDC_TCON_PIN_0	TCON0 is used for DE output.
	data enable signal (DE)	GLCDC_TCON_PIN_1	TCON1 is used for DE output.
		GLCDC_TCON_PIN_2	TCON2 is used for DE output.
		GLCDC_TCON_PIN_3	TCON3 is used for DE output.
output.data_enable_ polarity	Polarity of the data enable signal (DE)	GLCDC_SIGNAL_ POLARITY_LOACTIVE	Sets polarity to low active.
		GLCDC_SIGNAL_ POLARITY_HIACTIVE	Sets polarity to high active.
output.bg_color.byte.r	R value for the background color	00h to FFh	Specifies the R value for the background color.
output.bg_color.byte.g	G value for the background color	00h to FFh	Specifies the G value for the background color.
output.bg_color.byte.b	B value for the background color	00h to FFh	Specifies the B value for the background color.
input.format	Graphics format of the frame buffer	GLCDC_IN_FORMAT_ 32BITS_ARGB8888	ARGB8888 is used.
		GLCDC_IN_FORMAT_ 32BITS_RGB888	RGB888 is used.
		GLCDC_IN_FORMAT_ 16BITS_RGB565	RGB565 is used.
		GLCDC_IN_FORMAT_ 16BITS_ARGB1555	ARGB1555 is used.
		GLCDC_IN_FORMAT_ 16BITS_ARGB4444	ARGB4444 is used.
		GLCDC_IN_FORMAT_ CLUT8	8-bit CLUT is used.
		GLCDC_IN_FORMAT_ CLUT4	4-bit CLUT is used.
		GLCDC_IN_FORMAT_ CLUT1	1-bit CLUT is used.
input.p_base	Start address of the frame buffer	00000040h to FFFFFC0h Lower 6 bits are 0.	Specifies the start address of the frame buffer.
		NULL	The target graphics becomes disabled. (Setting values of structure members under glcdc_cfg_t.input are ignored.)

input.bg_color.byte.r	R value for the background color of graphics 1 and 2	00h to FFh	Specifies the R value for the background color of graphics 1 and 2.
input.bg_color.byte.g	G value for the background color of graphics 1 and 2	00h to FFh	Specifies the G value for the background color of graphics 1 and 2.
input.bg_color.byte.b	B value for the background color of graphics 1 and 2	00h to FFh	Specifies the B value for the background color of graphics 1 and 2.
input.hsize	Horizontal width of image data	See 5.1 Screen Definition.	Specifies the horizontal width of image for graphics 1 and 2.
input.vsize	Vertical width of image data	See 5.1 Screen Definition.	Specifies the vertical width of image for graphics 1 and 2.
input.offset	Macro line offset	-32768 to 32767	Specifies the macro line offset for graphics 1 and 2.
input.frame_edge	Show/hide setting of the graphics area	true	Sets the graphics area frame to be displayed.
	frame	false	Sets the graphics area frame not to be displayed.
input.coordinate.x	X-coordinate of display start position	See 5.1 Screen Definition.	Specifies the horizontal start position of the graphics area.
input.coordinate.y	Y-coordinate of display start position	See 5.1 Screen Definition.	Specifies the vertical start position of the graphics area.
blend.blend_control	Control setting for blending	GLCDC_BLEND_ CONTROL_NONE	Disables alpha blending.
		GLCDC_BLEND_ CONTROL_FADEIN	Sets to fade-in.
		GLCDC_BLEND_ CONTROL_FADEOUT	Sets to fade-out.
		GLCDC_BLEND_ CONTROL_FIXED	Sets to fixed alpha value.
		GLCDC_BLEND_ CONTROL_PIXEL	Sets to per-pixel alpha blending.
blend.visible	Show/hide setting	true	Sets the image to be displayed.
	of the image	false	Sets the image not to be displayed.
blend.frame_edge	Show/hide setting of the rectangle alpha blending area	true	Sets the frame of the rectangle alpha blending area to be displayed.
	frame	false	Sets the frame of the rectangle alpha blending area not to be displayed.
blend.fixed_blend_value	Fixed alpha value	00h to FFh	Specifies the fixed alpha value (valid only when blend_control is 'GLCDC_BLEND_CONTROL_FIXED').

blend.fade_speed	Alpha value to be increased/decreased	00h to FFh	Specifies the alpha value to be increased or decreased (valid only when blend_control is 'GLCDC_BLEND_ CONTROL _FADEIN' or 'GLCDC_BLEND _CONTROL_FADEOUT').
blend.start_coordinate.x	X-coordinate of the blending start position	See 5.1 Screen Definition.	Specifies the horizontal width of the rectangle alpha blending area and the horizontal start position
blend.end_coordinate.x	X-coordinate of the blending end position	See 5.1 Screen Definition.	of the rectangle alpha blending.
blend.start_coordinate.y	Y-coordinate of the blending start position	See 5.1 Screen Definition.	Specifies the vertical width of the rectangle alpha blending area and the vertical start position of the
blend.end_coordinate.y	Y-coordinate of the blending end position	See 5.1 Screen Definition.	rectangle alpha blending.
chromakey.enbale	Enable/disable	true	Enables chroma keying.
	setting of chroma key	false	Disables chroma keying. (Setting values of structure members under glcdc_cfg_t.chromakey are ignored.)
chromakey.before.byte.r	R value for chroma keying	00h to FFh	Specifies the R value for chroma keying.
chromakey.before.byte.g	G value for chroma keying	00h to FFh	Specifies the G value for chroma keying.
chromakey.before.byte.b	B value for chroma keying	00h to FFh	Specifies the B value for chroma keying.
chromakey.after.byte.a	A value after chroma key replacement	00h to FFh	Specifies the A value after replacement by chroma keying
chromakey.after.byte.r	R value after chroma key replacement	00h to FFh	Specifies the R value after replacement by chroma keying
chromakey.after.byte.g	G value after chroma key replacement	00h to FFh	Specifies the G value after replacement by chroma keying
chromakey.after.byte.b	B value after chroma key replacement	00h to FFh	Specifies the B value after replacement by chroma keying
output.endian	Bit endianness of	GLCDC_ENDIAN_LITTLE	Sets to little endian.
	the output data	GLCDC_ENDIAN_BIG	Sets to big endian.
output.color_order	Pixel sequence of the output data	GLCDC_COLOR_ ORDER_RGB	Sets the pixel sequence of the output data to R-G-B in order.
		GLCDC_COLOR_ ORDER_BGR	Sets the pixel sequence of the output data to B-G-R in order.

Graphic LCD Controller Module Using Firmware Integration Technology

output.correction_ proc_order	Sequence of correction processing	GLCDC_BRIGHTNESS _CONTRAST_TO_ GAMMA	Performs brightness and contrast adjustments first, and then gamma correction.
		GLCDC_GAMMA_TO_ BRIGHTNESS_ CONTRAST	Performs gamma correction first, and then brightness and contrast adjustments.
output.dithering. dithering_on	Dithering mode selection	true	Sets to '0: truncated, 1: rounded' or dithering with 2x2 pattern.
		false	Sets to 'truncated'. (Setting values of structure members under glcdc_cfg_t.output.dithering are ignored.)
output.dithering. dithering_mode	Dithering mode selection 2	GLCDC_DITHERING_ MODE_ROUND_OFF	Sets to '0: truncated, 1: rounded'.
		GLCDC_DITHERING_ MODE_2X2PATTERN	Sets to dithering with 2x2 pattern.
output.dithering. dithering_ pattern_a	Dithering pattern value A	GLCDC_DITHERING_ PATTERN_00	Specifies pattern value A of dithering with 2x2 pattern (valid
		GLCDC_DITHERING_ PATTERN_01	only when dithering_mode is 'GLCDC_DITHERING_MODE_ 2X2PATTERN').
		GLCDC_DITHERING_ PATTERN_10	
		GLCDC_DITHERING_ PATTERN_11	
output.dithering. dithering_ pattern_b	Dithering pattern value B	GLCDC_DITHERING_ PATTERN_00	Specifies pattern value B of dithering with 2x2 pattern (valid
		GLCDC_DITHERING_ PATTERN_01	only when dithering_mode is 'GLCDC_DITHERING_MODE_ 2X2PATTERN').
		GLCDC_DITHERING_ PATTERN_10	
		GLCDC_DITHERING_ PATTERN_11	
output.dithering. dithering_pattern_c	Dithering pattern value C	GLCDC_DITHERING_ PATTERN_00	Specifies pattern value C of dithering with 2x2 pattern (valid
		GLCDC_DITHERING_ PATTERN_01	only when dithering_mode is 'GLCDC_DITHERING_MODE_ 2X2PATTERN').
		GLCDC_DITHERING_ PATTERN_10	
		GLCDC_DITHERING_ PATTERN_11	
output.dithering. dithering_pattern_d	Dithering pattern value D	GLCDC_DITHERING_ PATTERN_00	Specifies pattern value D of dithering with 2x2 pattern (valid
		GLCDC_DITHERING_ PATTERN_01	only when dithering_mode is 'GLCDC_DITHERING_MODE_ 2X2PATTERN').
		GLCDC_DITHERING_ PATTERN_10	
<u> </u>		•	•

		GLCDC_DITHERING_ PATTERN_11	
output.brightness.	Enable/disable	true	Enables brightness adjustment.
enable	setting of brightness adjustment	false	Disables brightness adjustment. (Values for RGB brightness adjustment are set to 0 regardless of setting values of structure members under glcdc_cfg_t.output.brightness.)
output.brightness.r	Brightness adjust. value for R signal	0000h: -512	Specifies the brightness adjustment value for the R signal.
output.brightness.g	Brightness adjust. value for G signal	200h: 0	Specifies the brightness adjustment value for the G signal.
output.brightness.b	Brightness adjust. value for B signal	3FFh: +511	Specifies the brightness adjustment value for the B signal.
output.contrast.enable	Enable/disable setting of contrast	true	Enables contrast adjustment.
	adjustment	false	Disables contrast adjustment. (Values for RGB contrast adjustment are set to 1.000 regardless of setting values of structure members under glcdc_cfg_t.output.contrast.)
output.contrast.r	Contrast adjustment value for R signal	00h: 0/128 = 0.000 :	Specifies the contrast adjustment value for the R signal.
output.contrast.g	Contrast adjustment value for G signal	80h: 128/128 = 1.000 : FFh: 255/128 = 1.992	Specifies the contrast adjustment value for the G signal.
output.contrast.b	Contrast adjustment value for B signal		Specifies the contrast adjustment value for the B signal.
output.gamma.enable	Enable/disable	true	Enables gamma correction.
	setting of gamma correction	false	Disables gamma correction. (Setting values of structure members under glcdc_cfg_t.output.gamma are ignored.)
output.gamma.p_r	Gamma correction table for the R signal	See 5.2 Calculating Gamma Correction Value.	Specifies the gain value and the start threshold value for each R signal area.
output.gamma.p_g	Gamma correction table for the G signal	See 5.2 Calculating Gamma Correction Value.	Specifies the gain value and the start threshold value for each G signal area.
output.gamma.p_b	Gamma correction table for the B signal	See 5.2 Calculating Gamma Correction Value.	Specifies the gain value and the start threshold value for each B signal area.
clut.enable	Enable/disable	true	Update CLUT memory.
	setting of CLUT memory	false	Not update CLUT memory. (Setting values of structure

Graphic LCD Controller Module Using Firmware Integration Technology

			members under glcdc_cfg_t.clut are ignored.)
clut.p_base	Pointer to the start address of the CLUT memory	Other than NULL	Reads the value at the address designated by the pointer and copies it to the CLUT memory.
clut.start	Start entry number of the CLUT memory to be updated	0 to 255 (start + size < 257)	Starts updating the CLUT memory from the entry number specified.
clut.size	Entry size of the CLUT memory to be updated	1 to 256 (start + size < 257)	Updates the CLUT memory for the specified size.
detection.vpos_detect	Enable/disable setting of VPOS	true	Enables VPOS detection.
	detection	false	Disables VPOS detection.
detection.gr1uf_detect	Enable/disable setting of GR1UF	true	Enables GR1UF detection.
	detection	false	Disables GR1UF detection.
ε =	Enable/disable setting of GR2UF	true	Enables GR2UF detection.
	detection	false	Disables GR2UF detection.
interrupt.vpos_enable	Enable/disable setting of the	true	Enables the VPOS interrupt.
	VPOS interrupt	false	Disables the VPOS interrupt.
interrupt.gr1uf_enable	Enable/disable	true	Enables the GR1UF interrupt.
	setting of the GR1UF interrupt	false	Disables the GR1UF interrupt.
interrupt.gr2uf_enable	Enable/disable setting of the	true	Enables the GR2UF interrupt.
	GR2UF interrupt	false	Disables the GR2UF interrupt.

                                              /* Setting for blending is invalid. */
```

Properties

Prototyped in file "r glcdc rx if.h"

Description

This function releases the GLCDC module-stop state and software reset to enable the GLCDC operation. Then it specifies the panel clock, the panel output signal timing, background screen, graphics screen, CLUT memory, output data format, correction processing, and interrupts used by the GLCDC.

This function can be executed when the mode is 'GLCDC_STATE_CLOSED'. When processing in this function has been completed successfully, a transition is made to 'GLCDC_STATE_NOT_DISPLAYING'.

Reentrant

No.

Example

Special Notes:

If the target graphics screen is disabled by setting p_base to NULL in this function, the graphics screen setting in the R_GLCDC_LayerChange function and CLUT memory updates in the R_GLCDC_ClutUpdate function becomes disabled. To enable the disabled graphics, execute the R_GLCDC_Open function again and set the target graphics screen to be enabled.

R_GLCDC_Close ()

This function closes the GLCDC FIT module.

Format

Parameters

None.

Return Values

```
GLCDC_SUCCESS /* Processing has been completed successfully. */
GLCDC_ERR_NOT_OPEN /* R_GLCDC_Open has not been executed. */
GLCDC_ERR_INVALID_MODE /* Function cannot be executed in this mode. */
```

Properties

Prototyped in file "r glcdc rx if.h"

Description

To close the GLCDC FIT module, this function disables interrupts used by the GLCDC. Then it executes the software reset and place the GLCDC in the module-stop state.

This function can be executed when the mode is 'GLCDC_STATE_NOT_DISPLAYING'. When processing in this function has been completed successfully, a transition is made to 'GLCDC_STATE_CLOSED'.

Reentrant

No.

Example

```
volatile glcdc_err_t ret_glcdc;

ret_glcdc = R_GLCDC_Close();
if (GLCDC_SUCCESS != ret_glcdc)
{
      /* error processing */
}
```

Special Notes:

When this function is executed, registers except registers associated with the CLUT memory are initialized. To enable GLCDC operation again, specify necessary settings again when the R_GLCDC_Open function is executed.

R_GLCDC_Control ()

This function performs processing according to the control command.

Format

Parameters

glcdc_control_cmd_t cmd
Control command to specify.

void const * const p_args
Pointer to the setting parameters structure.

The following table lists available control commands. A void pointer set to the argument is cast to an appropriate type and processed.

Table 3.2	Control Commands of the R	_GLCDC_Control F	unction
-----------	---------------------------	------------------	---------

Command	Description	Type Set to p_args
GLCDC_CMD_START_ DISPLAY	Enables GLCDC operation and outputs image data on the LCD panel. This command can be executed when the mode is 'GLCDC_STATE_NOT_DISPLAYING'. When processing for this command has been completed successfully, a transition is made to 'GLCDC_STATE_ DISPLAYING'.	Not used. Set NULL or FIT_NO_FUNC.
GLCDC_CMD_STOP_ DISPLAY	Disables GLCDC operation. This command can be executed when the mode is 'GLCDC_STATE_DISPLAYING'. When processing for this command has been completed successfully, a transition is made to 'GLCDC_STATE_NOT_DISPLAYING'.	Not used. Set NULL or FIT_NO_FUNC.
GLCDC_CMD_SET_ INTERRUPT	Specifies interrupts used by the GLCDC. This command can be called at any time after the R_GLCDC_Open function is executed. The mode remains unchanged after processing for this command is complete.	glcdc_interrupt_cfg_t *
GLCDC_CMD_CLR_ DETECTED_STATUS	Clears the status flag for detection of graphics 2 specified line notification, detection of graphics 1 underflow, and detection of graphics 2 underflow. This command can be called at any time after the R_GLCDC_Open function is executed. The mode remains unchanged after processing for this command is complete.	glcdc_detect_cfg_t *
GLCDC_CMD_ CHANGE_BG_COLOR	Specifies background color of the background screen. The mode remains unchanged after processing for this command is complete.	glcdc_color_t *

The following lists the glcdc_interrupt_cfg_t structure members and setting values to be referenced. When the GLCDC_CMD_SET_INTERRUPT command is executed, only parameters listed below are referenced and the other parameters do not need to be specified.

Table 3.3 glcdc_interrupt_cfg_t Structure Members and Setting Values

Structure Member	Outline	Setting Value	Description
vpos_enable	Enable/disable setting of the VPOS interrupt	true	Enables the VPOS interrupt.
	the VPOS interrupt	false	Disables the VPOS interrupt.
gr1uf_enable	Enable/disable setting of the GR1UF interrupt	true	Enables the GR1UF interrupt.
	the GRIOF interrupt	false	Disables the GR1UF interrupt.
gr2uf_enable	Enable/disable setting of	true	Enables the GR2UF interrupt.
the GR2UF interrupt	false	Disables the GR2UF interrupt.	

The following lists the glcdc_detect_cfg_t structure members and setting values to be referenced. When the GLCDC_CMD_CLR_DETECTED_STATUS command is executed, only parameters listed below are referenced and the other parameters do not need to be specified.

Table 3.4 glcdc_detect_cfg_t Structure Members and Setting Values

Structure Member	Outline	Setting Value	Description
vpos_detect	Clearing the VPOS detection flag	true	Clears the VPOS detection flag.
	detection mag	false	Not clear the VPOS detection flag.
gr1uf_detect	Clearing the GR1UF detection flag	true	Clears the GR1UF detection flag.
	detection mag	false	Not clear the GR1UF detection flag.
gr2uf_detect Clearing the GR2UF detection flag	_	true	Clears the GR2UF detection flag.
	false	Not clear the GR2UF detection flag.	

The following lists the glcdc_color_t structure members and setting values to be referenced. When the GLCDC_CMD_CHANGE_BG_COLOR command is executed, only parameters listed below are referenced and the other parameters do not need to be specified.

Table 3.5 glcdc_color_t Structure Members and Setting Values

Structure Member	Outline	Setting Value	Description
byte.r	R value of the background color	00h to FFh	Specifies R value of the background color
byte.g	G value of the background color	00h to FFh	Specifies G value of the background color
byte.b	B value of the background color	00h to FFh	Specifies B value of the background color

R01AN3609EJ0100 Rev. 1.00 Oct. 02, 2017

Return Values

```
GLCDC_SUCCESS

/* Processing has been completed successfully. */
GLCDC_ERR_INVALID_PTR

GLCDC_ERR_INVALID_ARG

GLCDC_ERR_INVALID_MODE

GLCDC_ERR_NOT_OPEN

GLCDC_ERR_INVALID_UPDATE_TIMING

/* Processing has been completed successfully. */

/* The p_args parameter is NULL pointer. */

/* The argument set is invalid. */

/* Function cannot be executed in this mode. */

/* R_GLCDC_Open has not been executed. */

/* Update timing of the register is invalid. */
```

Properties

Prototyped in file "r_glcdc_rx_if.h"

Description

This function performs GLCDC control processing according to the control command.

Reentrant

No.

{

}

```
Example
/* Enables GLCDC operation */
volatile glcdc_err_t ret_glcdc;
ret glcdc = R GLCDC Control(GLCDC CMD START DISPLAY, NULL);
if (GLCDC SUCCESS != ret glcdc)
{
      /* error processing */
}
/* Disables GLCDC operation */
volatile glcdc err t ret glcdc;
ret glcdc = R GLCDC Control(GLCDC CMD STOP DISPLAY, NULL);
if (GLCDC SUCCESS != ret glcdc)
{
      /* error processing */
/* Changes enable/disable setting of the GLCDC interrupt */
volatile glcdc err t ret glcdc;
glcdc interrupt cfg t int cfg;
int cfg.vpos enable = true;
int cfq.grluf enable = true;
int cfg.gr2uf enable = true;
```

ret glcdc = R GLCDC Control(GLCDC CMD SET INTERRUPT, (void *)&int cfg);

if (GLCDC SUCCESS != ret glcdc)

/* error processing */

```
/* Clears the GLCDC detection status */
volatile glcdc_err_t ret_glcdc;
glcdc_detect_cfg_t detect_cfg;
detect cfg.vpos detect = true;
detect_cfg.gr1uf_detect = true;
detect_cfg.gr2uf_detect = true;
ret glcdc = R GLCDC Control(GLCDC CMD CLR DETECTED STATUS, (void *)&detect cfg);
if (GLCDC SUCCESS != ret glcdc)
      /* error processing */
}
/* Changes the GLCDC background color */
volatile glcdc err t ret glcdc;
glcdc_color_t bg_color;
bg color.byte.r = 0xFFh;
bg color.byte.g = 0xFFh;
bg color.byte.b = 0xFFh;
ret glcdc = R GLCDC Control(GLCDC CMD CHANGE BG COLOR, (void *)&bg color);
if (GLCDC SUCCESS != ret glcdc)
```

Special Notes:

}

/* error processing */

When the GLCDC_CMD_STOP_DISPLAY command is executed, the GLCDC stops its operation after the frame end of background generating block. To enable GLCDC operation again, wait for the frame end of an output signal to the LCD panel, and then enable GLCDC operation. Otherwise, the GLCDC may not operate correctly depending on the LCD panel used.

R_GLCDC_LayerChange ()

This function changes operation of graphics 1 and graphics 2.

Format

Parameters

glcdc_frame_layer_t frame
Graphics screen to change operation.

void const * const p_args

Pointer to the setting parameters structure.

The following lists the glcdc_runtime_cfg_t structure members and setting values to be referenced.

When this function is executed, only parameters listed below are referenced and the other parameters do not need to be specified.

Table 3.6 glcdc_runtime_cfg_t Structure Members and Setting Values

Structure Member	Outline	Setting Value	Description
input.format	Graphics format of the frame buffer	GLCDC_IN_FORMAT_ 32BITS_ARGB8888	ARGB8888 is used.
		GLCDC_IN_FORMAT_ 32BITS_RGB888	RGB888 is used.
		GLCDC_IN_FORMAT_ 16BITS_RGB565	RGB565 is used.
		GLCDC_IN_FORMAT_ 16BITS_ARGB1555	ARGB1555 is used.
		GLCDC_IN_FORMAT_ 16BITS_ARGB4444	ARGB4444 is used.
		GLCDC_IN_FORMAT_ CLUT8	8-bit CLUT is used.
		GLCDC_IN_FORMAT_ CLUT4	4-bit CLUT is used.
		GLCDC_IN_FORMAT_ CLUT1	1-bit CLUT is used.
input.p_base	Start address of the frame buffer	00000040h to FFFFFC0h Lower 6 bits are 0.	Specifies the start address of the frame buffer.
input.bg_color.byte.r	R value of the background color for graphics 1 and 2.	00 to FFh	Specifies the R value of the background color for graphics 1 and 2.
input.bg_color.byte.g	G value of the background color for graphics 1 and 2.	00 to FFh	Specifies the G value of the background color for graphics 1 and 2.
input.bg_color.byte.b	B value of the background color for graphics 1 and 2.	00 to FFh	Specifies the B value of the background color for graphics 1 and 2.
input.hsize	Horizontal width of image data	See 5.1 Screen Definition.	Specifies the horizontal width of image for graphics 1 and 2.

Graphic LCD Controller Module Using Firmware Integration Technology

input.vsize	Vertical width of image data	See 5.1 Screen Definition.	Specifies the vertical width of image for graphics 1 and 2.
input.offset	Macro line offset	-32768 to 32767	Specifies the macro line offset for graphics 1 and 2.
input.frame_edge	Show/hide setting of the graphics area	true	Sets the graphics area frame to be displayed.
	frame	false	Sets the graphics area frame not to be displayed.
input.coordinate.x	X-coordinate of display start position	See 5.1 Screen Definition.	Specifies the horizontal start position of the graphics area.
input.coordinate.y	Y-coordinate of display start position	See 5.1 Screen Definition.	Specifies the vertical start position of the graphics area.
blend.blend_control	Control setting for blending	GLCDC_BLEND_ CONTROL_NONE	Disables alpha blending.
		GLCDC_BLEND_ CONTROL_FADEIN	Sets to fade-in.
		GLCDC_BLEND_ CONTROL_FADEOUT	Sets to fade-out.
		GLCDC_BLEND_ CONTROL_FIXED	Sets to fixed alpha value.
		GLCDC_BLEND_ CONTROL_PIXEL	Sets to per-pixel alpha blending.
blend.visible	Show/hide setting of	true	Sets the image to be displayed.
	the image	false	Sets the image not to be displayed.
blend.frame_edge	Show/hide setting of the rectangle alpha blending area frame	true	Sets the rectangle alpha blending area frame to be displayed.
		false	Sets the rectangle alpha blending area frame not to be displayed.
blend.fixed_blend_value	Fixed alpha value	00h to FFh	Specifies the fixed alpha value (valid only when blend_control is 'GLCDC_BLEND_ CONTROL_FIXED').
blend.fade_speed	Alpha value to be increased/decreased	00h to FFh	Specifies the alpha value to be increased or decreased (valid only when blend_control is 'GLCDC_BLEND_ CONTROL_FADEIN' or 'GLCDC_BLEND_ CONTROL_FADEOUT').
blend.start_coordinate.x	X-coordinate of the blending start position	See 5.1 Screen Definition.	Specifies the horizontal width of the rectangle alpha blending area and the horizontal start
blend.end_coordinate.x	X-coordinate of the blending end position	See 5.1 Screen Definition.	position of the rectangle alpha blending.

blend.start_coordinate.y	Y-coordinate of the blending start position	See 5.1 Screen Definition.	Specifies the vertical width of the rectangle alpha blending area and the vertical start
blend.end_coordinate.y	Y-coordinate of the blending end position	See 5.1 Screen Definition.	position of the rectangle alpha blending.
chromakey.enbale	Enable/disable setting	true	Enables chroma keying.
	of chroma keying	false	Disables chroma keying. (Setting value of structure members under glcdc_runtime_cfg_t.chromakey are ignored.)
chromakey.before.byte.r	R value for chroma keying	00h to FFh	Specifies the R value for chroma keying.
chromakey.before.byte.g	G value for chroma keying	00h to FFh	Specifies the G value for chroma keying.
chromakey.before.byte.b	B value for chroma keying	00h to FFh	Specifies the B value for chroma keying.
chromakey.after.byte.a	A value after chroma key replacement	00h to FFh	Specifies the A value after replacement by chroma keying
chromakey.after.byte.r	R value after chroma key replacement	00h to FFh	Specifies the R value after replacement by chroma keying
chromakey.after.byte.g	G value after chroma key replacement	00h to FFh	Specifies the G value after replacement by chroma keying
chromakey.after.byte.b	B value after chroma key replacement	00h to FFh	Specifies the B value after replacement by chroma keying

if (GLCDC SUCCESS != ret glcdc)
{
      /* error processing */
}
```

Special Notes:

None.

R_GLCDC_ColorCorrection ()

This function changes settings for brightness, contrast, and gamma correction of the GLCDC.

Format

Parameters

```
glcdc_correction_cmd_t cmd
Command to change the setting
void const * const p_args
Pointer to the setting parameter structure
```

The following table lists the available control commands. A void pointer set to the argument is cast to an appropriate type and processed.

Table 3.7	Control Commands of the R_GLCDC_ColorCorrection Function

Command	Description	Type Set to p_args
GLCDC_CORRECTION_ CMD_SET_ALL	Specifies settings for brightness and contrast adjustments, and gamma correction.	glcdc_correction_t *
GLCDC_CORRECTION_ CMD_BRIGHTNESS	Specifies the setting for brightness adjustment.	glcdc_brightness_t *
GLCDC_CORRECTION_ CMD_CONTRAST	Specifies the setting for contrast adjustment.	glcdc_contrast_t *
GLCDC_CORRECTION_ CMD_GAMMA	Specifies the setting for gamma correction.	glcdc_gamma_ correction_t *

The following lists the glcdc_correction_t structure members and setting values to be referenced. When the GLCDC_CORRECTION_CMD_SET_ALL command is executed, only parameters listed below are referenced and the other parameters do not need to be specified.

Table 3.8 glcdc_correction_t Structure Members and Setting Values

Structure Member	Outline	Setting Value	Description
brightness.enable	Enable/disable	true	Enables brightness adjustment.
	setting of brightness adjustment	false	Disables brightness adjustment. (Values for RGB brightness adjustment are set to 0 regardless of setting values of the structure members under glcdc_correction_t.brightness.)
brightness.r	Brightness adjust. value for R signal	000h: -512 :	Specifies the brightness adjustment value for the R signal.
brightness.g	Brightness adjust. value for G signal	200h: 0	Specifies the brightness adjustment value for the G signal.
brightness.b	Brightness adjust. value for B signal	3FFh: +511	Specifies the brightness adjustment value for the B signal.
contrast.enable	Enable/disable	true	Enables contrast adjustment.
	setting of contrast adjustment	false	Disables contrast adjustment. (Values for RGB contrast adjustment are set to 1.000 regardless of setting values of structure members under glcdc_correction_t.contrast)
contrast.r	Contrast adjustment value for R signal	00h: 0/128 = 0.000	Specifies the contrast adjustment value for the R signal.
contrast.g	Contrast adjustment value for G signal	80h: 128/128 = 1.000	Specifies the contrast adjustment value for the G signal.
contrast.b	Contrast adjustment value for B signal	: FFh: 255/128 = 1.992	Specifies the contrast adjustment value for the B signal.
gamma.enable	Enable/disable	true	Enables gamma correction.
	setting of gamma correction	false	Disables gamma correction. (Setting values of structure members under glcdc_correction_t.gamma are ignored.)
gamma.p_r	Gamma correction table for the R signal	See 5.2 Calculating Gamma Correction Value.	Specifies a gain and start threshold value for each R signal area.
gamma.p_g	Gamma correction table for the G signal	See 5.2 Calculating Gamma Correction Value.	Specifies a gain and start threshold value for each G signal area.
gamma.p_b	Gamma correction table for the B signal	See 5.2 Calculating Gamma Correction Value.	Specifies a gain and start threshold value for each B signal area.

The following lists the glcdc_brightness_t structure members and setting values to be referenced. When the GLCDC_CORRECTION_CMD_BRIGHTNESS command is executed, only parameters listed below are referenced and the other parameters do not need to be specified.

Table 3.9 glcdc_brightness_t Structure Members and Setting Values

Structure Member	Outline	Setting Value	Description
enable	Enable/disable setting of brightness	true	Enables brightness adjustment.
	adjustment	false	Disables brightness adjustment. (Values for RGB brightness adjustment are set to 0 regardless of setting values of structure members under glcdc_brightness_t.)
r	Brightness adjust. value for R signal	000h: -512 :	Specifies the brightness adjustment value for the R signal.
g	Brightness adjust. value for G signal	200h: 0	Specifies the brightness adjustment value for the G signal.
b	Brightness adjust. value for B signal	3FFh: +511	Specifies the brightness adjustment value for the B signal.

The following lists the glcdc_contrast_t structure members and setting values to be referenced. When the GLCDC_CORRECTION_CMD_CONTRAST command is executed, only parameters listed below are referenced and the other parameters do not need to be specified.

Table 3.10 glcdc_contrast_t Structure Members and Setting Values

Structure Member	Outline	Setting Value	Description
enable	Enable/disable	true	Enables contrast adjustment.
	setting of contrast adjustment	false	Disables contrast adjustment. (Values for RGB contrast adjustment are set to 1.000 regardless of setting values of structure members under glcdc_contrast_t)
r	Contrast adjustment value for R signal	00h: 0/128 = 0.000 :	Specifies the contrast adjustment value for the R signal.
g	Contrast adjustment value for G signal	80h: 128/128 = 1.000	Specifies the contrast adjustment value for the G signal.
b	Contrast adjustment value for B signal	FFh: 255/128 = 1.992	Specifies the contrast adjustment value for the B signal.

The following lists the glcdc_gamma_correction_t structure members and setting values to be referenced. When the GLCDC_CORRECTION_CMD_ GAMMA command is executed, only parameters listed below are referenced and the other parameters do not need to be specified.

Table 3.11 glcdc_gamma_correction_t Structure Members and Setting Values

Structure Member	Outline	Setting Value	Description
enable	Enable/disable	true	Enables gamma correction.
	setting of gamma correction	false	Disables gamma correction. (Setting values of structure members under glcdc_gamma_correction_t are ignored.)
p_r	Gamma correction table for the R signal	See 5.2 Calculating Gamma Correction Value.	Specifies a gain and start threshold value for each R signal area.
p_g	Gamma correction table for the G signal	See 5.2 Calculating Gamma Correction Value.	Specifies a gain and start threshold value for each G signal area.
p_b	Gamma correction table for the B signal	See 5.2 Calculating Gamma Correction Value.	Specifies a gain and start threshold value for each B signal area.

Return Values

GLCDC_SUCCESS	/* Processing has been completed successfully. */
GLCDC_ERR_INVALID_PTR	/* The p_args parameter is NULL pointer. */
GLCDC_ERR_INVALID_ARG	/* The argument set is invalid. */
GLCDC ERR INVALID MODE	/* Function cannot be executed in this mode. */
GLCDC ERR NOT OPEN	/* R GLCDC Open has not been executed. */
GLCDC_ERR_INVALID_UPDATE_TIMING	/* $Update\ timing\ of\ the\ register\ is\ invalid.\ */$
GLCDC_ERR_INVALID_GAMMA_SETTING	/* Gamma correction setting is invalid. */

Properties

Prototyped in file "r_glcdc_rx_if.h"

Description

This function changes settings for brightness, contrast, and gamma correction of the GLCDC. The setting to be changed is determined according to the first parameter of this function.

This function can be executed when the mode is 'GLCDC_STATE_DISPLAYING'. The mode remains unchanged after processing for this command is complete.

Reentrant

No.

```
Example
/* Changes settings for all items */
volatile glcdc err t ret glcdc;
glcdc correction t correction cfg;
correction cfg.brightness.enable = true;
correction cfg.brightness.r = 0x200;
correction cfg.brightness.g = 0x200;
correction_cfg.brightness.b = 0x200;
correction cfg.contrast.enable = true;
correction cfg.contrast.r = 0x80;
correction cfg.contrast.g = 0x80;
correction_cfg.contrast.b = 0x80;
correction cfg.gamma.enable = true;
correction_cfg.gamma.p_r = (gamma_correction_t *)&g_gamma_table;
correction cfg.gamma.p g = (gamma correction t *) & g gamma table;
correction cfg.gamma.p b = (gamma correction t *) & g gamma table;
ret glcdc = R GLCDC ColorCorrection (GLCDC CORRECTION CMD SET ALL,
                                     (void *)&correction cfg);
if (GLCDC SUCCESS != ret glcdc)
      /* error processing */
/* Changes the setting for brightness adjustment */
volatile glcdc err t ret glcdc;
glcdc_brightness_t brightness_cfg;
brightness cfg.enable = true;
brightness_cfg.r = 0x200;
brightness\_cfg.g = 0x200;
brightness cfg.b = 0x200;
ret_glcdc = R_GLCDC_ColorCorrection(GLCDC_CORRECTION_CMD_BRIGHTNESS,
                                     (void *)&brightness cfg);
if (GLCDC SUCCESS != ret glcdc)
```

/* error processing */

{

Special Notes:

R_GLCDC_ClutUpdate ()

This function updates the CLUT memory of the GLCDC.

Format

Parameters

glcdc_frame_layer_t frame
Graphics screen to change operation
glcdc_clut_cfg_t p_clut_cfg
Pointer to the CLUT memory structure

The following lists the glcdc_clut_cfg_t structure members and setting values to be referenced.

When this function is executed, only parameters listed below are referenced and the other parameters do not need to be specified.

Table 3.12 glcdc_clut_cfg_t Structure Members and Setting Values

Structure Member	Outline	Setting Value	Description
enable	Enable/disable setting of CLUT	true	Update CLUT memory.
memory	, and the second	false	Not update CLUT memory, if this function is executed.
p_base	Pointer to the start address of the CLUT memory	Other than NULL	Reads the value at the address designated by the pointer and copies it to the CLUT memory.
start	Start entry number of the CLUT memory to be updated	0 to 255 (start + size < 257)	Starts updating the CLUT memory from the entry number specified.
size	Entry size of the CLUT memory to be updated	1 to 256 (start + size < 257)	Updates the CLUT memory for the specified size.

Return Values

```
GLCDC_SUCCESS

/* Processing has been completed successfully. */
GLCDC_ERR_INVALID_PTR

GLCDC_ERR_INVALID_ARG

GLCDC_ERR_INVALID_MODE

GLCDC_ERR_NOT_OPEN

GLCDC_ERR_INVALID_UPDATE_TIMING
GLCDC_ERR_INVALID_CLUT_ACCESS

/* Processing has been completed successfully. */

/* The p_clut_cfg parameter is NULL pointer. */

/* The argument set is invalid. */

/* Function cannot be executed in this mode. */

/* R_GLCDC_Open has not been executed. */

/* Update timing of the register is invalid. */

/* CLUT memory setting is invalid. */
```

Properties

Prototyped in file "r_glcdc_rx_if.h"

Description

This function updates the CLUT memory of the GLCDC.

This function can be executed when the mode is 'GLCDC_STATE_DISPLAYING'. The mode remains unchanged after processing in this function is complete.

Reentrant

No.

Example

```
/* Updates all the CLUT memory for graphics 1 */
volatile glcdc_err_t ret_glcdc;
glcdc_clut_cfg_t clut_cfg;

clut_cfg.enable = true;
clut_cfg.p_base = (uint32_t *)g_gr_clut_table;
clut_cfg.size = 256;
clut_cfg.start = 0;

ret_glcdc = R_GLCDC_ClutUpdate(GLCDC_FRAME_LAYER_1, &clut_cfg);
if (GLCDC_SUCCESS != ret_glcdc)
{
        /* error processing */
}
```

Special Notes:

R_GLCDC_GetStatus ()

This function obtains the GLCDC status.

Format

Parameters

Pointer to the structure which stores the obtained status.

Table 3.13 glcdc_status_t Structure Members and Setting Values

Structure Member	Outline	Setting Value	Description
state	Transition status of the GLCDC FIT	GLCDC_STATE_NOT_ DISPLAYING	GLCDC stopped.
	module	GLCDC_STATE_ DISPLAYING	GLCDC operating.
state_vpos	Detection status of graphics 2 specified	GLCDC_NOT_ DETECTED	Not detected.
	line notification	GLCDC_DETECTED	Detected.
state_gr1uf Detection status of graphics 1 underflow		GLCDC_NOT_ DETECTED	Not detected.
		GLCDC_DETECTED	Detected.
state_gr2uf	Detection status of graphics 2 underflow	GLCDC_NOT_ DETECTED	Not detected.
		GLCDC_DETECTED	Detected.
fade_status	Fading status of graphics 1 and 2	GLCDC_FADE_STATUS_ NOT_UNDERWAY	Fade-in/fade-out being stopped.
		GLCDC_FADE_STATUS_ FADING_UNDERWAY	Fade-in/fade-out being executed.
		GLCDC_FADE_STATUS_ UNCERTAIN	Register value being specified for the graphics.

Return Values

```
GLCDC_SUCCESS /* Processing has been completed successfully. */
GLCDC_ERR_INVALID_PTR /* The p_status parameter is NULL pointer: */
GLCDC_ERR_NOT_OPEN /* R_GLCDC_Open has not been executed. */
```

Properties

Prototyped in file "r glcdc rx if.h"

Description

This function obtains the GLCDC status. The obtained status is written to the p_status structure passed with the argument.

This function can be called at any time after the R_GLCDC_Open function is executed. The mode remains unchanged after processing in this function is complete.

Reentrant

No.

Example

```
/* Obtains the GLCDC status */
volatile glcdc_err_t ret_glcdc;
glcdc_status_t status;

ret_glcdc = R_GLCDC_GetStatus(&status);
if (GLCDC_SUCCESS != ret_glcdc)
{
         /* error processing */
}
```

Special Notes:

R_GLCDC_GetVersion ()

This function returns the current version of this API.

Format

```
uint32_t R_GLCDC_GetVersion (void)
```

Parameters

None.

Return Values

Version of this API.

Properties

Prototyped in file "r_glcdc_rx_if.h"

Description

This function will return the version of the currently running API. The version number is encoded where the top 2 bytes are the major version number and the bottom 2 bytes are the minor version number. For example, Version 4.25 would be returned as 0x00040019.

Reentrant

Yes.

Example

```
/* Gets the GLCDC FIT module version. */
volatile uint32_t version;

version = R_GLCDC_GetVersion();
```

Special Notes:

4. Pin Setting

To use the GLCDC FIT module, assign input/output signals of the peripheral function to pins with the multi-function pin controller (MPC). The pin assignment is referred to as the "Pin Setting" in this document. Please perform the pin setting after calling the R_GLCDC_Open function.

When performing the Pin Setting in the e² studio, the Pin Setting feature of the FIT configurator or the Smart Configurator can be used. When using the Pin Setting feature, a source file is generated according to the option selected in the Pin Setting window in the FIT configurator or the Smart Configurator. Pins are configured by calling the function defined in the source file. Refer to Table 4.1 for details.

Table 4.1 Function Output by the FIT Configurator

MCU used	Function generated	Remarks
RX65N	R_GLCDC_PinSet()	

5. Using the GLCDC FIT Module

5.1 Screen Definition

In the GLCDC FIT module, reference points, the active display area, and the display start position for each screen are determined based on the parameter values of functions R_GLCDC_Open and R_GLCDC_LayerChange. Specify the arguments referencing Figure 5.1 Screen Definition and Table 5.1 Arguments and Available Setting Values.

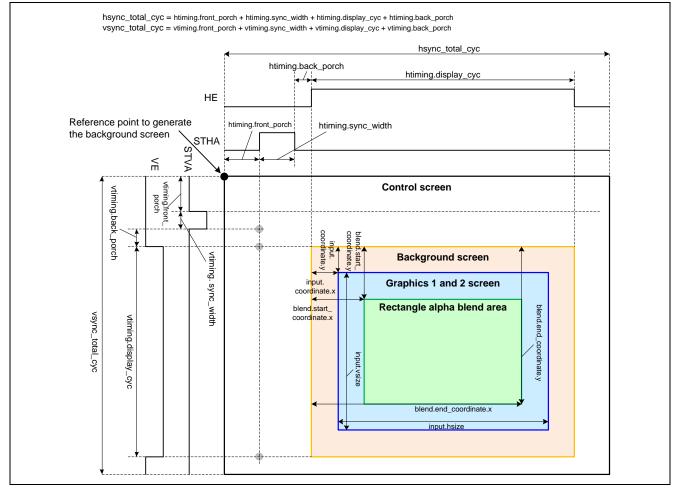

Figure 5.1 Screen Definition

Table 5.1 Arguments and Available Setting Values

Argument Name	Setting Value	Remarks
htiming.front_porch	2 < htiming.front_porch < 18	Specify a value in the range 23 < hsync_total_cyc < 1025 where hsync_total_cyc =
htiming.back_porch	0 < htiming.back_porch	(htiming.front_porch + htiming.back_porch + htiming.display_cyc + htiming.sync_width).
htiming.display_cyc	15 < htiming.display_cyc	Specify a value in the range 5 <
htiming.sync_width	0 ≤ htiming.sync_width	((htiming.front_porch - 2) + htiming.back_porch + htiming.sync_width).
		When using dithering with 2x2 pattern, specify htiming.display_cyc to a multiple of 4.
vtiming.front_porch	1 < vtiming.front_porch < 17	Specify a value in the range 19 < vsync_total_cyc < 1025 where vsync_total_cyc =
vtiming.back_porch	0 < vtiming.back_porch	(vtiming.front_porch + vtiming.back_porch +
vtiming.display_cyc	15 < vtiming.display_cyc	vtiming.display_cyc + vtiming_syncwidth).
vtiming.sync_width	0 ≤ vtiming.sync_width	Specify a value in the range 2 < ((vtiming.front_porch - 1) + vtiming.back_porch + vtiming.sync_width).
		When using dithering with 2x2 pattern, specify vtiming.display_cyc to a multiple of 2.
input.hsize	15 < input.hsize < (htiming.display_cyc + 1)	Specify an even value.
input.coordinate.x	0 ≤ input.coordinate.x < (htiming.display_cyc - 15)	Specify a value in the range (input.coordinate.x + input.hsize) < (htiming.display_cyc + 1).
input.vsize	15 < input.vsize < (vtiming.display_cyc + 1)	
input.coordinate.y	0 ≤ input.coordinate.y < (vtiming.display_cyc - 15)	Specify a value in the range (input.coordinate.y + input.vsize) < (vtiming.display_cyc + 1).
blend.start_coordinate.x	0 ≤ blend.start_coordinate.x < blend.end coordinate.x <	Specify a value in the range (htiming.back_porch + htiming.sync_width + blend.start_coordinate.x) <
blend.end_coordinate.x	htiming.display_cyc and 0 ≤	1006.
blend.start_coordinate.x < blend.end_coordinate.x < 1017		If use horizontal range between 100 and 200, set blend.start_coordinate.x to 100 and blend.end_coordinate.x to (200 + 1).
blend.start_coordinate.y	0 ≤ blend.start_coordinate.y < blend.end_coordinate.y <	Specify a value in the range (vtiming.back_porch + vtiming.sync_width + blend.start_coordinate.y) <
blend.end_coordinate.y	vtiming.display_cyc and 0 ≤	1007.
	blend.start_coordinate.y < blend.end_coordinate.y < 1021	If use vertical range between 100 and 200, set blend.start_coordinate.y to 100 and blend.end_coordinate.y to (200 + 1).

5.2 Calculating Gamma Correction Value

This section describes how to calculate a gamma correction value in the GLCDC FIT module.

By using the gamma correction feature in the GLCDC FIT module, brightness of the LCD panel can be adjusted based on the characteristic of the panel used. To perform gamma correction properly, specify a gain value to the GAMxLUTn register (n = 1 to 8) and a threshold value of the area to the GAMxAREAn register (n = 1 to 5).

An example below describes calculation of the gain value for each area.

$$Dout = \left(\frac{Din}{pixel}\right)^{\frac{1}{\gamma}} \times pixel$$

In the above calculation formula, γ is gamma, *pixel* is the number of pixels, *Din* is a brightness value before correction, and *Dout* is a brightness value after correction. Note that the GLCDC calculates I/O signal with 10 bits. Thus *pixel* becomes 1023.

For example, if the width is set to 64 for each area and the gamma value γ is 0.7, then, when *Din* is 0 *Dout* becomes 0, and when *Din* is 64 *Dout* becomes 19.512.

$$gain = \frac{Dout_{m+1} - Dout_m}{width} \quad (m = 0 \text{ to } 15)$$

In the above calculation formula, Dout(m+1) is a brightness value after correction for area 1, Dout(m) is a brightness value after correction for area 0, and *width* is the width of the area 0 when calculating the gain value of the area 0.

The gain value for area 0 becomes 0.304875 with the formula above. The gain value set to the register for area 0 becomes " $0.304875 \times 1024 = 312$ (rounding off one decimal place)". Repeat the procedure above for 16 areas and configure the gamma correction table.

Set the threshold for setting the width of each area to be TH(k) < TH(k+1). However, only in case of TH(k) = 0x3FF, it can be TH(k) = TH(k+1).

An example below shows configuring the gamma correction table with each gamma correction value.

```
/* Gamma correction table when the gamma correction value is 0.5 */
const gamma correction t g gamma table =
 /* gain (r = 0.5) */
 { 64, 192, 320, 448, 577, 705, 833, 961, 1089, 1217, 1345, 1473, 1602,
  1730, 1858, 1954 },
 /* threshold */
 { 64, 128, 192, 256, 320, 384, 448, 512, 576, 640, 704, 768, 832, 896, 960 }
 };
^{\prime \star} Gamma correction table when the gamma correction value is 0.7 ^{\star \prime}
const gamma correction t g gamma table =
 /* gain (r = 0.7) */
 { 312, 528, 659, 762, 849, 926, 995, 1057, 1116, 1170, 1222, 1270, 1316, 1361,
  1403, 1421 },
 /* threshold */
 { 64, 128, 192, 256, 320, 384, 448, 512, 576, 640, 704, 768, 832, 896, 960 }
/* Gamma correction table when the gamma correction value is 0.9 */
const gamma correction t g gamma table =
 /* gain (r = 0.9) */
 { 753, 873, 925, 961, 988, 1010, 1029, 1046, 1061, 1074, 1086, 1097, 1107,
 1117, 1126, 1116 },
 /* threshold */
 { 64, 128, 192, 256, 320, 384, 448, 512, 576, 640, 704, 768, 832, 896, 960 }
/* Gamma correction table when the gamma correction value is 1.1 */
const gamma_correction_t g_gamma_table =
 /* gain (r = 1.1) */
 { 1317, 1157, 1103, 1069, 1045, 1026, 1010, 997, 986, 976, 967, 959, 952, 945,
  939, 919 },
 /* threshold */
 { 64, 128, 192, 256, 320, 384, 448, 512, 576, 640, 704, 768, 832, 896, 960 }
};
 /* Gamma correction table when the gamma correction value is 1.3 */
 const gamma correction t g gamma table =
 /* gain (r = 1.3) */
 { 1941, 1367, 1211, 1119, 1056, 1008, 970, 938, 911, 888, 868, 850, 834, 819,
 806, 781 },
 /* threshold */
 { 64, 128, 192, 256, 320, 384, 448, 512, 576, 640, 704, 768, 832, 896, 960 }
};
```

5.3 Notes on Blending Setting

In the Show/hide setting of the image, Control setting for blending, Enable/disable setting of chroma keying, there are limitation to the combination of the setting values. The combination of setting values shows Table 5.2 Combination of Setting Values. Don't use other than combination of setting values described.

Table 5.2 Combination of Setting Values

Show/hide setting of the graphics (blend.visible)	Control setting for blending (blend.blend_control)	Enable/disable setting of chroma keying (chromakey.enable)	Display contents
false	GLCDC_BLEND_ CONTROL_NONE	false	Lower-layer graphics
false	GLCDC_BLEND_ CONTROL_PIXEL	false	Lower-layer graphics
true	GLCDC_BLEND_ CONTROL_NONE	false	Current graphics
true	GLCDC_BLEND_ CONTROL_FADEIN	true	Within rectangular area, Fade-in of current graphics and lower-layer graphics. Outside rectangular area, per-pixel alpha blending of chroma keyed current graphics and lower-layer graphics
		false	Within rectangular area, Fade-in of current graphics and lower-layer graphics. Outside rectangular area, per-pixel alpha blending of current graphics and lower-layer graphics
true	GLCDC_BLEND_ CONTROL_FADEOUT	true	Within rectangular area, Fade-out of current graphics and lower-layer graphics. Outside rectangular area, per-pixel alpha blending of chroma keyed current graphics and lower-layer graphics
		false	Within rectangular area, Fade-out of current graphics and lower-layer graphics. Outside rectangular area, per-pixel alpha blending of current graphics and lower-layer graphics
true	GLCDC_BLEND_ CONTROL_FIXED *1	true	Within rectangular area, Rectangular alpha blending of current graphics and lower-layer graphics. Outside rectangular area, per-pixel alpha blending of chroma keyed current graphics and lower-layer graphics
		false	Within rectangular area, Rectangular alpha blending of current graphics and lower-layer graphics. Outside rectangular area, per-pixel alpha blending of current graphics and lower-layer graphics
true	GLCDC_BLEND_ CONTROL_PIXEL	true	Per-pixel alpha blending of chroma keyed current graphics and lower-layer graphics
		false	Per-pixel alpha blending of current graphics and lower-layer graphics

Notes: 1. If this value is set on the graphics screen, the obtained status "fade_status" when executing R_GLCDC_GetStatus function is always "GLCDC_FADE_STATUS_FADING_UNDERWAY".

6. Appendices

6.1 Operation Confirmation Environment

This section describes operation confirmation environment for the GLCDC FIT module.

Table 6.1 Operation Confirmation Environment

Item	Contents	
Integrated development environment	Renesas Electronics e ² studio Version 6.0.0.001	
	Renesas Electronics C/C++ Compiler Package for RX Family V2.07.00	
C compiler	Compiler option: The following option is added to the default settings of the integrated development environment.	
	-lang = C99	
Endian	Big endian/little endian	
Revision of the module	Rev.1.00	
Board used	Renesas Starter Kit+ for RX65N-2MB (product No.: RTK50565N2SxxxxxBE)	

6.2 Troubleshooting

- (1) Q: I have added the FIT module to the project and built it. Then I got the error: Could not open source file "platform.h".
 - A: The FIT module may not be added to the project properly. Check if the method for adding FIT modules is correct with the following documents:
 - Using CS+:
 - Application note "Adding Firmware Integration Technology Modules to CS+ Projects (R01AN1826)"
 - Using e² studio:
 - Application note "Adding Firmware Integration Technology Modules to Projects (R01AN1723)"

When using a FIT module, the board support package FIT module (BSP module) must also be added to the project. For this, refer to the application note "Board Support Package Module Using Firmware Integration Technology (R01AN1685)".

- (2) Q: I have added the FIT module to the project and built it. Then I got the error: This MCU is not supported by the current r_glcdc_rx module.
 - A: The FIT module you added may not support the target device chosen in your project. Check the supported devices of added FIT modules.
- (3) Q: I have added the FIT module to the project and built it. Then I got an error for when the configuration setting is wrong.
 - A: The setting in the file "r_glcdc_rx_config.h" may be wrong. Check the file "r_glcdc_rx_config.h". If there is a wrong setting, set the correct value for that. Refer to 2.7 Configuration Overview for details.
- (4) Q: Image data are not displayed on LCD panel.
 - A: The pin setting may not be performed correctly. When using this FIT module, the pin setting must be performed. Refer to 4 Pin Setting for details.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Handling of Unused Pins

Handle unused pins in accordance with the directions given under Handling of Unused Pins in the manual.

The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.

2. Processing at Power-on

The state of the product is undefined at the moment when power is supplied.

- The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied.
 - In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed.

In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.

3. Prohibition of Access to Reserved Addresses

Access to reserved addresses is prohibited.

 The reserved addresses are provided for the possible future expansion of functions. Do not access these addresses; the correct operation of LSI is not guaranteed if they are accessed.

4. Clock Signals

After applying a reset, only release the reset line after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.

When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.

5. Differences between Products

Before changing from one product to another, i.e. to a product with a different part number, confirm that the change will not lead to problems.

The characteristics of Microprocessing unit or Microcontroller unit products in the same group but having a different part number may differ in terms of the internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Notice

- 1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
- 2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other disputes involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawing, chart, program, algorithm, application
- 3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
- 4. You shall not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copy or otherwise misappropriation of Renesas Electronics products.
- 5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below
 - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots etc.

"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc

Renesas Electronics products are neither intended nor authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems, surgical implantations etc.), or may cause serious property damages (space and undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for which the product is not intended by Renesas

- 6. When using the Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat radiation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions or failure or accident arising out of the use of Renesas Electronics products beyond such specified
- 7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please ensure to implement safety measures to guard them against the possibility of bodily injury, injury or damage caused by fire, and social damage in the event of failure or malfunction of Renesas Electronics products, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures by your own responsibility as warranty for your products/system. Because the evaluation of microcomputer software alone is very difficult and not practical, please evaluate the safety of the final products or systems manufactured by you.
- 8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please investigate applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU ROHS Directive carefully and sufficiently and use Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations
- 9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall not use Renesas Electronics products or technologies for (1) any purpose relating to the development, design, manufacture, use, stockpiling, etc., of weapons of mass destruction, such as nuclear weapons, chemical weapons, or biological weapons, or missiles (including unmanned aerial vehicles (UAVs)) for delivering such weapons, (2) any purpose relating to the development, design, manufacture, or use of conventional weapons, or (3) any other purpose of disturbing international peace and security, and you shall not sell, export, lease, transfer, or release Renesas Electronics products or technologies to any third party whether directly or indirectly with knowledge or reason to know that the third party or any other party will engage in the activities described above. When exporting, selling, transferring, etc., Renesas Electronics products or technologies, you shall comply with any applicable export control laws and regulations promulgated and administered by the governments of the countries asserting jurisdiction over the parties or transactions.
- 10. Please acknowledge and agree that you shall bear all the losses and damages which are incurred from the misuse or violation of the terms and conditions described in this document, including this notice, and hold Renesas Electronics harmless, if such misuse or violation results from your resale or making Renesas Electronics products available any third party.
- 11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
- 12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries

(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
